Known Issues 11

Overview

Skytree is an enterprise-grade software platform for developing, testing, and deploying advanced analytic solutions for big data. With a broad set of machine learning methods, Skytree works on massive, fast changing, and varied datasets in distributed computing environments with a high degree of efficiency and accuracy.

Skytree is comprised of two components: Skytree Server™ and Skytree Platform™. These release notes describe the new features, bug fixes, and other changes made in Skytree Platform.

Skytree Platform includes Python SDK functions and REST API calls for preparing data and for training, tuning, and testing models. Skytree Platform also includes a graphical user interface for training and testing models.

For additional information about Skytree, refer to the documentation available on support.skytree.net.

Version 15.4.0

Version 15.4.0 provides new features, bug fixes, and other changes to Skytree Platform.

New Features

- Sources, Datasets, Models, and Results can now be deleted.
- Datasets can now be transformed through the GUI.
- In the GUI, the graphs for datasets, models, and results now show upstream and downstream files associated with each. Similarly, users can retrieve this dependency information through the Python SDK and REST API. Knowing this information is useful when deleting resources, as all dependent resources are also deleted.
- A right-click option is available on the GUI graphs, allowing you to view details of the resource and to delete the resource. When right-clicking on a dataset, you can also specify to transform the dataset.
- You no longer have to specify environments when training and testing models. Skytree will display the resources that are available as well as the resources that will be used to complete the request.
- The YARN application log for a data import/preparation/transformation job is now made available to the UI in the Log tab of the Dataset Details page.
- A link to the YARN job monitor page for a data import/preparation/transformation job is now made available to the UI in the job progress information.
- Admins can now restrict Skytree Platform to run on a subset of Hadoop cluster nodes via:
 - Dynamic resource pool using named queues
 - Node name patterns

Bug Fixes

The following issues were fixed in this version of Skytree Platform:

Table 1: Bug Fixes in Skytree Platform 15.4.0 - General

Issue ID	Description
N/A	When deleting Projects and Plots, the backend functionality now correctly removes all data from the environment. In prior versions, the data was hidden from the user but still existed in the environment. Note that when upgrading to 15.4.0, all hidden (deleted) files will be removed from the environment.
SYS-1654	Fixed an issue that occurred when attempting to run ML on a dataset in which a categorical column has all missing values. Users no longer receive a "No dictionary available for column <colname>" error. Instead, the column is now ignored, and users receive this information in a warning.
SYS-1477	Users can now specify a smart search seed when running GLMR with smart search
N/A	Error messages from Core now convert values to MB or GB as appropriate.

Table 2: Bug Fixes in Skytree Platform 15.4.0 - REST API

Issue ID	Description
SYS-1712	The plot generation process can now be interrupted.

Table 3: Bug Fixes in Skytree Platform 15.4.0 - GUI

Issue ID	Description
MLUI-316	Fixed message display for progress of Plot creation.
MLUI-473	Fixed an issue that caused existing plots to fail to display after one plot was deleted.

Table 4: Bug Fixes in Skytree Platform 15.4.0 - SDK

Issue ID	Description
N/A	Users can now successfully train models without specifying a configuration (i.e., using only default values).

Other Changes

The following updates were made in this version of Skytree Platform:

Table 5: Other Changes in Skytree Platform 15.4.0 - General

Issue ID	Description
SYS-768	For columns with more than 2048 categorical values, the column is converted to non-categorical text in order to limit the dictionary size.

Table 5: Other Changes in Skytree Platform 15.4.0 - General (continued)

Issue ID	Description
SYS-1451	Improved the way default values are handled during a smart-search run.
SYS-1681	Kerberos support added for PySpark jobs.

Table 6: Other Changes in Skytree Platform 15.4.0 - GUI

Issue ID	Description
MLUI-401, 402	Improved status messages that display when adding dataset and when building and testing models.
MLUI-543	Users are now redirected to the GUI login page if a 403 Forbidden error is encountered (for example, if authentication times out).

Table 7: Other Changes in Skytree Platform 15.4.0 - Python SDK

Issue ID	Description
SYS-1684	The <code>add_unique_id()</code> function now automatically sets the new column as the ID column.
N/A	A <code>terminate()</code> function is now available for interrupting INPROGRESS Plots.

Version 15.3.0

Version 15.3.0 provides new features, bug fixes, and other changes to Skytree Platform.

Note: The minimum required Python SDK version for Skytree 15.3.0 is Skytree Python SDK 15.2.0. However, we recommend you upgrade Python SDK to 15.3.0 using:
`python setup.py install`

New Features

- A new script-based installer is available, which provides an easier installation experience.
- The Skytree installation process now includes a built-in license file, which notifies users when their Skytree license expires.
- The Generalized Linear Models Classification (GLMC) method is now available for performing machine learning on classification problems. Note that similar to SVM, GLMC models can be built from datasets that have no more than one categorical column.
- In AutoModel, GBT, GBTR, GLMC, GLMR, and SVM (linear), users can now specify an Enable Partial Dependencies option, which creates a file to store the partial dependencies of the relevant features and/or feature pairs in a JSON format. These pairs can then be used to generate partial dependence plots.
- Users can now generate plots for an interactive, visualized information display. When used with models, these plots show the dependence between a feature or set of features marginalized over all other features. When used

with results, the plots show either the relation between predictors and actual outcomes (regression) or the capture deviation information (classification).

- In the GUI, view cost/benefit weighted evaluations for classification results by adjusting the true positive/negative benefit and the false positive/negative cost.
- For classification results, a new Adjust Probability Threshold slider is available in the GUI for viewing specific True/False positive rates.
- In the GUI, users can now download the Labels, Probabilities, and Targets files that are generated with a test result.
- Projects can now be deleted.

Bug Fixes

The following issues were fixed in this version of Skytree Platform:

Table 8: Bug Fixes in Skytree Platform 15.3.0 - General

Issue ID	Description
SYS-1524	Increased the default values for Spark Resource Allocation in skytree.properties.
SYS-1526	Fixed the error message that displays when users attempt to update their password using an invalid password.

Table 9: Bug Fixes in Skytree Platform 15.3.0 - GUI

Issue ID	Description
MLUI-73	When registering a dataset via HDFS, the HDFS field now pre-populates with <code>hdfs:///</code> .
MLUI-86	When adding a dataset, fixed an issue that caused long column names in the Objective Column drop-down to display incorrectly.
MLUI-94	The Sampling Ratio option is now included in the output when viewing tuning results for a model.
MLUI-97	When adding datasets, the heading case is now retained in View Dataset Details.
MLUI-152	When adding a dataset via HDFS, previewing, then changing the HDFS dataset file, the preview now correctly updates to show the new dataset.
MLUI-155	When adding a dataset without selecting the "First Line Has Column Names" option, previewing, deselecting that option and previewing again, the resulting preview no longer includes two header rows.

Table 10: Bug Fixes in Skytree Platform 15.3.0 - Python SDK

Issue ID	Description
SYS-1000	Fixed an issue that caused the YARN cluster to hang when running multiple train requests in parallel.
SYS-1301	Fixed an issue that caused RDF training to fail due to incorrect parameter validation.

Table 10: Bug Fixes in Skytree Platform 15.3.0 - Python SDK (continued)

Issue ID	Description
SYS-1622	The <code>set_as_id()</code> transform now persists through additional transforms. In prior versions, this transform was recommended to be the final transform when creating a testing dataset.

Other Changes

The following updates were made in this version of Skytree Platform:

Table 11: Other Changes in Skytree Platform 15.3.0 - General

Issue ID	Description
SYS-1532	Skytree now requires Spark version 1.5.1 with Scala 2.11.
SYS-1467	Skytree now makes use of a Dataframe RDD instead of String Array JavaRDD when performing transforms. This change will both improve performance and decrease memory usage, especially on large datasets.

Table 12: Other Changes in Skytree Platform 15.3.0 - Python SDK

Issue ID	Description
SYS-1413	The following transform functions have been renamed: <code>dataset.ingest_text()</code> has been renamed <code>dataset.ingest_url()</code> <code>dataset.ingest_self_contained_text()</code> has been renamed <code>dataset.ingest_text()</code>

Version 15.2.1

Version 15.2.1 includes a bug fix and updates to Skytree Platform.

Bug Fixes

The following issues were fixed in this version of Skytree Platform:

Table 13: Skytree Platform 15.2.1 Bug Fixes - General

Issue ID	Description
CORE-1818	Fixed an issue that occurred when <code>gbt</code> was the selected method when tuning/training a model with <code>automodel</code> . In some cases, the configuration file that was returned for the best model included incorrect values as well as values for parameters that were unset.

Other Changes

The following updates were made in this version of Skytree Platform:

Table 14: Other Changes in Skytree Platform 15.2.1 - General

Issue ID	Description
PAAS-414	Added support for the following YARN platforms: - HDP 2.2.8 and 2.3 - CDH 5.4.5 and 5.4.6
SYS-1597	A new property can be set during the installation: <code>skytree_java_home</code> . This property allows you to specify the version of Java that you want Skytree to use, which can be important if the desired version is different than the cluster's default Java version. Note that when setting this, all nodes on the cluster should have the desired version of Java installed in the same location.
N/A	When using Skytree with High Availability (HA), the following recommended properties have been updated. Refer to the <i>Skytree Installation Guide</i> for more information about using Skytree with HA. <code>spark_status_server_url</code> <code>skytree_ipc_callback_server_host</code> <code>skytree_ipc_callback_server_port</code>

Version 15.2.0

Version 15.2.0 provides new features, bug fixes, and other changes to Skytree Platform.

Note: The minimum required Python SDK version for Skytree 15.2.0 is Skytree Python SDK 15.1.1. However, we recommend you upgrade Python SDK to 15.2.0 using:
`python setup.py install`

New Features

- The Generalized Linear Models Regression (GLMR) method is now available for performing machine learning on regression problems. Note that similar to SVM, GMLR models can be built from datasets that have no more than one categorical column.
- Five new transforms have been added for preparing datasets that contain text/blob columns, allowing datasets to be created from .doc, .ppt, .pdf, .html, and raw text files.
 - Ingest Self Contained Text
 - Ingest Text
 - Tokenize Text
 - Extract Text Features
 - Vectorize Text

- When running smart search GBT, GBTR, and SVM, users can now specify to limit the default parameter settings. Previously, this option was only available in AutoModel.

Bug Fixes

The following issues were fixed in this version of Skytree Platform:

Table 15: Bug Fixes in Skytree Platform 15.2.0 - General

Issue ID	Description
SYS-1442	Fixed an issue that caused the Spark DAG to be evaluated multiple times.
SYS-1453	Fixed an issue that resulted in an error when a non-committed dataset was used during testing.

Table 16: Bug Fixes in Skytree Platform 15.2.0 - GUI

Issue ID	Description
SI-273	Project names and descriptions can now be modified via the GUI.
UI-178	Results can now be renamed.
UI-302	The Status column can now be sorted.
SYS-1429	Fixed an issue that caused certain source files to fail to import correctly through the GUI.
MLUI-5, AD-623	When logged in as an Admin, the Usage page now displays properly in Firefox.
MLUI-21	Fixed an issue that caused an incorrect number of dictionary entries to display when viewing dataset features.
MLUI-40	When using Mozilla Firefox, users are now aware that the page is refreshing when they click the Redraw button on the View Graphs page.
MLUI-41	Fixed an issue that caused large datasets to time out prematurely.

Other Changes

The following updates were made in this version of Skytree Platform:

Table 17: Other Changes in Skytree Platform 15.2.0 - General

Issue ID	Description
SYS-1402	A new property can be set during the installation for users who run Skytree using LDAP with SSL/TLS: <code>skytree_ldap_use_start_tls</code> .

Table 18: Other Changes in Skytree Platform 15.2.0 - GUI

Issue ID	Description
MLUI-43	Updated styles for improved consistency throughout the GUI.
n/a	When importing datasets, a raw stream of data displays immediately when a dataset is selected. In addition, a preview of the dataset now displays on the same screen as the Import Dataset form rather than as a separate popup.

Version 15.1.1.1

Version 15.1.1.1 includes a bug fix to Skytree Platform.

Note: This version of Skytree Platform is compatible with Skytree Server 15.1.1.

Bug Fixes

The following issue was fixed in this version of Skytree Platform:

Table 19: Bug Fixes in Skytree Platform 15.1.1.1- General

Issue ID	Description
SYS-1398	When authenticating via LDAP, two new properties were added to the <code>/etc/skytree/skytree.properties</code>: <code>skytree_ldap_email_attribute=mail</code> - The e-mail lookup is set to look at the AD <code>mail</code> attribute when authenticating. Users can change this to <code>cn</code> or <code>display_name</code>. and <code>skytree_ldap_default_realm=example.com</code> - If no e-mail address is found for the user, then compose an e-mail address using the user's common name and the default realm (i.e., <code>cn@realm</code>). These properties allow for cases when the AD <code>mail</code> attribute does not contain a valid e-mail address for the user. If the AD <code>mail</code> attribute contains a valid e-mail address, then these can remain commented out.

Version 15.1.1

Version 15.1.1 includes new features, enhancements, and bug fixes to Skytree Platform.

Note: This version of Skytree Platform is compatible with Skytree Server 15.1.1.

New Features

- Skytree users can now be authenticated via LDAP authentication. Refer to the *Skytree Installation Guide* for information on how to set up Skytree to use LDAP.

- Admins can now create and manage users and resources/environments via the GUI.
- The Skytree GUI now displays the variable importances of features included in GBT and GBTR models.

Bug Fixes

The following issues were fixed in this version of Skytree Platform:

Table 20: Bug Fixes in Skytree Platform 15.1.1 - General

Issue ID	Description
SYS-1303	Fixed an issue that caused an infinite loop when transitioning from Prediction to Scoring. This occurred when a running service was not found.

Table 21: Bug Fixes in Skytree Platform 15.1.1 - GUI

Issue ID	Description
SYS-1292	Datasets that were created from probabilities, targets, or labels now include the result ID on the View Graph page.
MLUI-19	Fixed an issue that prevented Admins from modifying their own password and role.
UI-189	Users can no longer view logs that are empty.
UI-411	The Status column no longer truncates INPROGRESS statuses.
AD-619	Fixed an issue that resulted in a 400 Bad Request error when viewing the Projects page. This occurred when 0 projects existed.
UI-107	When a user selects an icon in the View Graph page, the icon is no longer deselected after the graph is re-drawn/refreshed.
MLUI-8	Users can no longer access the Admin role by changing the URL. Similarly, Admin users can no longer access all project capabilities by changing the URL.

Other Changes

The following updates were made in this version of Skytree Platform:

Table 22: Other Changes in Skytree Platform 15.1.1 - General

Issue ID	Description
SYS-1337	REST API and Python SDK authentication requests now use a userName keyword instead of an email keyword. The Skytree GUI also authenticates with a Username. This username can be either the user's login name (when using LDAP) or the user's e-mail address (when not using LDAP).
n/a	Apache Spark™ is required, but it is no longer installed with Skytree.

Table 23: Other Changes in Skytree Platform 15.1.1 - Python SDK

Issue ID	Description
n/a	ClassificationTestResult.get_labels(), ClassificationTestResult.get_probabilities(), and RegressionTestResult.get_targets() are now generators that can be iterated over.
SYS-1359	Users can now collect split datasets without unpacking by either specifying a single return value (list) or specifying multiple return values (datasets). In the latter case, not that you must specify the correct number of return values.
SYS-1352	The ML methods now reside in their own modules. This avoids clashes that can occur for options that exist in multiple methods, such as classification_objective

Version 15.1.0.1

Version 15.1.0.1 includes new features and enhancements to the Skytree Python SDK.

Note: This version of Skytree Platform is compatible with Skytree Server 15.1.0.

New Features

- Added support for custom transforms in the Python SDK.
- Chained transformations are now supported in the Python SDK using a new `apply_transform_steps()` function.

Other Changes

The following updates were made in this version of Skytree Platform:

Table 24: Other Changes in Skytree Platform 15.1.0.1 - SDK

Issue ID	Description
N/A	Improved validation of parameters.

Version 15.1.0

Version 15.1.0 includes new features, bug fixes, and enhancements to Skytree Platform.

Note: This version of Skytree Platform is compatible with Skytree Server 15.1.0.

New Features

- This version of Skytree includes a new graphical user interface (GUI). Datasets that are either imported or registered through the Skytree GUI can be explored and used to train and test machine learning models. All

datasets, data transformations, models, and train/test results are displayed in an easy to understand visual format, whether built from within the GUI or through the Python SDK. (Note that in Skytree 15.1.0, data transformations are only maintained via the Python SDK.)

- Tree viewer provides an interactive means to see how the data is organized for tree-based methods.
- Introduced a new project-based environments. Users now set up individual projects and store all associated datasets, model, and results within the project.
- Administrator ability to create users, assign roles, and reset user passwords.
- Administrators now create execution environments during the installation process, allocating the number of containers in each environment and specifying the amount of memory and number of cores for each container. Refer to the *Skytree Installation Guide* for more information.
- In addition to manual tuning using default values or a grid search, a new `automodel` module is available for tuning and testing classification and regression models. Using a minimum set of parameters, this module automatically selects the appropriate model with appropriate parameter settings.
- Added support for training classification models using svm (Support Vector Machines). Three distinct SVM kernels are offered: linear, polynomial, and RBF.
- Smart search support added to distributed binary-class GBT.
 - Using the smartSearch options, GBT automatically searches for the best parameter settings.
 - Users no longer have to specify a variety of configuration options in order to return the best results.
 - Users can still enter commands to specify the tuning range for each parameter or enter the value for certain parameters and let GBT tune over the rest.
- A new "Remove Column" transformation is available.
- A new "Add Unique ID Column" transformation is available.
- Users can now create source files from Classification and Regression test files.
- Users can explicitly commit a dataset without performing an ML method.
- SAMPLED and COMMITTED sub-statuses are now available for READY datasets. These sub-statuses allow users to know whether a dataset's statistics are from sampled data or from the full set of data.
- Skytree Platform now integrates status update changes that come from Skytree Server.
- Users can now download READY test results that are streamed to their local machines.
- Users can now retrieve column statistics for a dataset using the REST API.
- Users can retrieve log files for models and test results.
- Users can now generate header/stats on Spark.
- PMML output can be streamed for the following models: GBT, GBTR, RDF, and RDRF.
- New PMML Evaluator that provides a Java Archive Repository to score new data for a model's PMML.

Known Issues

The following known issues exist in Skytree Platform:

Table 25: Known Issues in Skytree Platform - General

Issue ID	Description
SYS-1445	When training a model, GLM does not validate that the dataset training column ranges are within acceptable bounds.
SYS-1454	Embedded images such as .jpeg and .png will cause an error when ingesting Microsoft Word and Microsoft PowerPoint documents.
SYS-1043	Due to constraints with Spark, you cannot chain more than 400 total operations when transforming a dataset. This constraint applies to the entire life cycle of a dataset (i.e., from source, through multiple transforms, to final dataset). A workaround is to create an intermediate dataset and continue additional transform steps from there on.
SYS-1187	Multi-class classification is not supported.
SYS-1206	When performing a Right Outer Join transform, the left table's column name still remains in the output.
SYS-1280	YARN timeout errors are not reported back to the user.

Table 26: Known Issues in Skytree Platform - GUI

Issue ID	Description
N/A	When setting the ID column or adding BLOB columns, an "identify transform" will be automatically added if no other transforms are specified. The transform API currently requires there to be at least one transform when changing these values. The transform will show as "lambda identityTransform: true" in the transform preview area and in the graph for the transformed dataset.
MLUI-81	Session timeouts do not work correctly. In some cases, navigating to the GUI after the session expires (6 hours of inactivity) opens Skytree. Only after attempting an action in the GUI will the user be notified of the session timeout and be prompted to log in again.
SYS-1329	Datasets with malformed or inconsistent rows may display in the Dataset list. Skytree will filter out these inconsistent rows when a new dataset is created from this.
SI-145	Variable importances are shown in binary decision trees (model visualization) but not shown in results.
UI-22	In list views, user needs to refresh the browser after certain off-page operations, e.g. changing the name/description of a dataset or model may not be reflected in the dataset/model list until the browser is refreshed.
UI-71	In some list views, the vertical scroll bar is off the right side of the visible page.
UI-72	The browser Back button sometimes takes the user back more than one page. Use the breadcrumbs trail to navigate back up the hierarchy.
UI-88	DAG layout issues: Complex graphs sometimes cause node and label overlaps and unclear routing of connections between nodes. DAG uses auto-layout functions, and a re-draw button is provided for user to try different layouts.
UI-106	On some large/complex DAGs, nodes are not visible on the screen even when zoomed out to maximum. Users may need to pan up and down to see extremes.
UI-107	Refreshing the DAG causes a selected node/path to become unselected.

Table 26: Known Issues in Skytree Platform - GUI (continued)

Issue ID	Description
UI-124	Some error messages appear off the top of the page (above the top fold).
UI-217	Project IDs are not shown on the project card but can be copied from the browser's URL field.
UI-326	Dataset metadata cannot be seen through the UI after it's been set.
UI-411	The INPROGRESS status is often truncated in the status column.
UI-412	In the admin UI resource monitor, the resources shown are requested resources, not consumed resources.
UI-413	Some error messages do not include a reason.
Various	The user and resource configuration (environment) admin tasks can be done via the SDK but not through the UI.
n/a	Users can terminate jobs via the SDK but not through the UI.

Table 27: Known Issues in Skytree Platform - Python SDK

Issue ID	Description
SYS-1300	Columns that are set with a categorical type of number display as (Type = Text Categorical = True).
SYS-795	When the skytree-platform service is not running, a confusing message appears after stopping the service.
SYS-845	When an ID column is set in a dataset, the dataset summary does not include the ID column.
SYS-1042	The <code>terminate()</code> function does not terminate etl jobs, YARN jobs in the queue, or YARN jobs that do not respond to a signal to stop soon enough.
SYS-1044	The <code>get_</code> functions (<code><model>.get_log()</code> , <code>get_labels()</code> , <code>get_probabilities()</code> , etc.) return the full log in a string rather than allowing the user to stream.
SYS-1046	Dataset summaries include a "project_id None" string.
SYS-1183	Dataset summaries do not include the dataset configuration.
SYS-1259	When datasets are created using the <code>split()</code> transform the summary of the new dataset does not include the index of the split from which it originated.
SYS-1260	For transformed datasets, the dataset summary does not include the originating dataset.

Table 28: Known Issues in Skytree Platform - REST API

Issue ID	Description
SYS-1271	When interrupting a model through the REST API, a message displays incorrectly indicating that the process failed.
