MULTI-LANGUAGE SUPPORT PORTING GUIDE

1.1. Overview

This document shows how to add multi-language support and localization to SecureCore Tiano. The steps include adding the desired language or languages to the Language Lookup Table, adding a String Token for each language, and then finally adding the translated strings to the appropriate `<file_extension>` file.

1.2. Before You Begin

1.2.1. Additional Documentation

This document assumes that you have an understanding of the following documents:

- RFC 4646 - Tags for Identifying Languages
- UEFI Specification v2.2

1.2.2. Fonts

1. Ensure that you have the correct fonts installed in the `<folder_name>` folder.
2. Ensure that your language and font are mapped in the `<file_name>` file as shown below. Note that the language tag is described in RFC 4646.

```
# <code snippet removed for confidentiality>
```

1.3. Add a Language to the Language Lookup Table

Perform the following steps to add a language to the Language Lookup Table.

1. The translation between a language value and a string is done through the `<file_name>` file.
2. Add a language the the `<table_name>=` line using the language tag specified in RFC 4646. The following are already included.

```
<table snippet removed for confidentiality>
```

Note: The language value is related to the index in the above table, which translates the setup value into a UEFI-compatible language string. So in the above code, the language value for US English would be `<integer>`, Korean would be `<integer>`, and so on.

1.4. Adding a String Token

The following steps show how to add a string token.

1. Open the `<file_name>` file.
2. Add the `STRING_TOKEN` for the new language as shown below.

```
<code snippet removed for confidentiality>
```

Note that in the above code, `<function_name>` refers to the second language value. The `<value>` portion corresponds to the table in Section 1.3, which indicates that French corresponds to the `<integer>` value.

As an example, add the following line to support Korean:

```
<code snippet removed for confidentiality>
```

1.5. Adding Localization to SCT Strings

SCT Setup strings are contained in `<file_extension>` files. Localization is done directly within these files. For example, perform the following steps to add Korean text to the “Advanced” menu item string.

1. Open the `<file_name>` file.
2. Add a line for Korean translation of the word “Advanced” as shown below.

```
<code snippet removed for confidentiality>
```

3. Rebuild SCT when you are finished localizing each .uni file.
